

Infosys in the Mobile Arena

Business is continuing to become increasingly mobile with wireless technologies enabling superior user experience when compared to conventional access technologies. Technical breakthroughs have resulted in wireless mobile devices becoming compact and powerful enabling easy portability. Convergence has enabled increased access to networks and tools which make the bulk of your business travel with you.

The Infosys Wireless footprint extends across varied sections of business, right from the simple Wireless Lab systems for Internet Guest Access to complicated RFID asset tracking systems for the retail industry. Infosys leverages its extensive experience in wireless applications and rich domain expertise for your business advantage.

Infosys' end-to-end Wireless Capabilities

Infosys' Wireless Center of Excellence

The Wireless Center of Excellence (CoE) at Infosys's research group pursues multiple R&D projects in the wireless domain, with a research bias towards various services characterized by mobility, wireless connectivity and smart spaces (an environment that interacts with users and devices). Driven by the convergence of multiple wireless technologies around mobile devices and an industry trend to integrate mobility as "one of many channels" in a large IT solution, the CoE focuses on mobile platforms, wireless data network and access network technologies, core switching, network management & planning, service provider infrastructure and wireless applications. The CoE is responsible for tracking key technologies and applications that enable "Anytime Anywhere Anything" access to information services. Infosys has built a carrier-class software infrastructure and portfolio of 'building-block' components and applications in the wireless space that enable our customers, and its strategic partners to 'mobilize' businesses extremely rapidly and cost effectively.

Infosys handles IT solutions & mobile applications for an European Mobile Service Provider
